

Using the internet, research how a cheese of your choice is made, how a beer of your choice is produced, and how a wine of your choice is made. Be sure your research includes the role of microbes in the production of these food items.

When you're done researching, compile what you learned into a three-slide PowerPoint presentation. On the first slide, identify the cheese you researched, identify the microbes involved in its production, and explain the role of the microbes in the production process. On the second slide, include the same points for the beer you researched, and on the third slide, cover the same information for the wine you researched.
